

RESTORATION TECHNIQUE: Shoreline Shoal

HABITAT TYPE : Sheltered Embayments

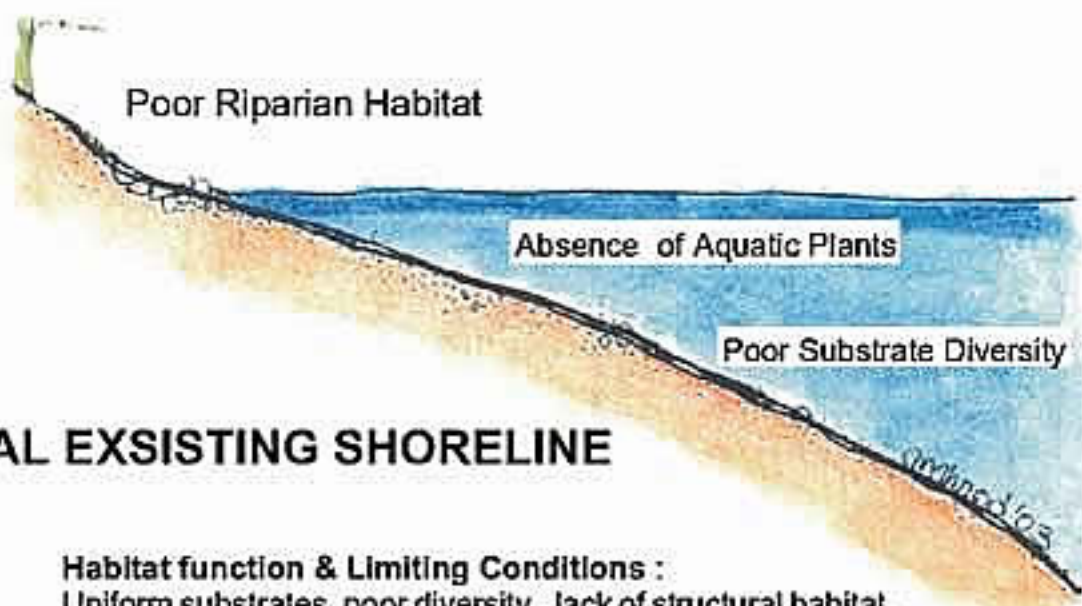

Targets

- Increase areas of primary production
- Improve forage for aquatic and terrestrial species
- Add structural elements to improve near shore habitats

Anchor woody debris strategically along the point and arrange shoal material to create back water areas favourable to submergent vegetation. Enhanced points and shoals can form important features to bracket and improve adjacent features

RESTORATION TECHNIQUE: Shoreline Shoal Sections

HABITAT TYPE : Sheltered Embayments

Habitat function & Limiting Conditions :
Uniform substrates, poor diversity, lack of structural habitat, favours opportunistic species like mature carp and sucker, overall poor productivity
